

Plants

Create a class called Plants that uses the attributes listed down below. The constructor of your class needs to be handed over values for Name, Water reservoir, Sunlight reserve and Nutrients, while Height and Mass start out with a value of 0. Make sure that the values (excluding the Name) you're handing over to the constructor stay in the definition range indicated by the first table (the lower border is 0).

- Name
- Height
- Mass
- Water reservoir
- Sunlight reserve
- Nutrients
- status

Height and Mass should be numerical values, while the name should be a string value. Water reservoir, Sunlight reserve and Nutrients are private attributes that tell whether or not the plant is in good shape. If either of these attributes reach zero the status of the plant changes accordingly (see table below). If all three attributes reach zero or are over the maximum at the same time the status changes to "dead" and can't be changed afterwards (we can't resurrect the dead).

Attribute	Max Value	= 0	Over Maximum
Water reservoir	25	dehydrated	overhydrated
Sunlight reserve	250	withered	burnt
Nutrients	1000	malnourished	overfed

The class should have the methods shown in the table below and fulfill the given tasks. The last column tells you the value by which the value of the corresponding attribute should be adjusted. For the methods growing, blossoming, form_fruit and procreate you must make sure that the plant has enough Nutrients, water and sunlight to fulfill the task. Be careful that the plant doesn't reach zero during these tasks. If the plant has not enough reserves for the corresponding task, decrease the values of your attributes by only 10% of the given values in the table and print out a warning message.

Method	Task	Increase/Decrease
shading	lower the sunlight reserve	3.3
sunbathing	increase the sunlight reserve	4.6
watering	increase the water reservoir	0.8
drinking	decrease the water reservoir	1.3
feeding	increase the Nutrients	12.7
eating	decrease the Nutrients	14.6
growing	increase Mass & Height Decrease Nutrients, water reservoir & sunlight reserve	your choice 17.9, 1.7 & 5.7
blossoming	Decrease Nutrients, water reservoir & sunlight reserve	22.4, 2.1 & 6.9
form_fruit	Decrease Nutrients, water reservoir & sunlight reserve	178.6, 13.4, 10.8
procreate	Decrease Nutrients, water reservoir & sunlight reserve	267.6, 81.3, 14.9

Define the string-method (`__str__`) for your class so that you get a printout as shown below.

Don't forget that this method needs to return a single string value.

Example printout:

Plant: `Pyrus anatolica`

Height: `10.2`

Mass: `250.7`

status: `OK`
