

Snake

Create a GUI for a simplified Snake game. The GUI should include four Buttons and one Label/Frame that represents the snake. The Buttons should be placed on the sides of your GUI and should allow your snake (the Label/Frame) to move accordingly (see image below for an example).

The functions for the buttons should look as follows:

```
def increase_y():  
    curr_y = frame1.winfo_y()+50  
    curr_x = frame1.winfo_x()+25  
    frame1.place(width=50,height=50,x=curr_x,y=curr_y)
```

With the method() `winfo_y()` or `winfo_x()` you can read out the current coordinates of your Frame/Label. Afterwards you can adjust them by adding a certain amount (here 50 pixel) to adjust the placement of your Frame/Label. Like this you're able to move the Frame/Label

around on your GUI. Depending on your usage of place you might need to play around with the values of `curr_y` and `curr_x` in the function above.

Once you're able to move around your Frame/Label on your GUI, adjust your functions so that the Frame/Label can not move over your Buttons. You need to create an if statement inside your functions to make sure the Frame/Label stays in bounds.

In a third step add other Labels/Frames as "Fruits" to your GUI so that your "Snake" can "eat" them. To achieve this, you need to check in your functions whether your "Snake" is at coordinates that overlap with the coordinates of your "Fruits". Once your "Snake ate" a "Fruit" make sure that it disappears from your GUI (use the `place_forget()` method on the corresponding Frame/Label). Include at least 3 "Fruits" for this task.
